                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of phytoene synthases and zeta-carotene desaturase from Nicotiana tabacum. The sequences can be used to identify compounds capable of altering the expression of these genes, which are therefore useful as plant growth regulators and herbicides. They can also be used to produce transgenic plants. The present sequence is the coding sequence of a tobacco
                                                                                                                                                                                                                                                                                                                                                                                                               phytoene synthase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and/or total carotenoid contents in transgenic plant cells, plants or other host cells or organisms (e.g. algae) by inhibiting the endogenous zeaxanthin epoxidase (ZEP) activity. The invention also discloses transgenic plant cells or plants, their harvested products, replicative material (protoplasts, calli, seeds, tubers and cuttings) and descendants, produced by the novel method. The method is used to increase production of zeaxanthin and total carotenoids (including the therapeutic antioxidant alpha-tocopherol) for food supplementation. This sequence represents a polynucleotide corresponding to the tobacco (Nicotiana tabacum) phytoene synthase (Pys) gene which is used to describe the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1573
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Examples; Page

                                                                                                                                                                                                                                                                                                                                                                       This sequence encodes the phytoene synthetase from Nicotiana tabacum. The phytoene synthetase coding sequence represents a CDNA of the invention. The isolated nucleic acid molecules are used for producing recombinant polypeptides or transgenic plants with enhanced ability to synthesise carotenoids. Phytoene has been used as a ultra violet absorber and other carotenoids have been used as food colours, animal feeds and in the pharmaceutical and cosmetics industries.
                                                                                                                                                                                                                                                                                                                                                 Sequence 1826

The sequences can be used to identify compounds capable of altering the expression of these genes, which are therefore useful as plant growth regulators and herbicides. They can also be used to produce transgenic plants. The present sequence is the coding sequence of a tobacco

                                                                                                                                                                                                                                                                         This sequence encodes the phytoene synthetase from Nicotiana tabacum. The phytoene synthetase coding sequence represents a cDNA of the invention. The isolated nucleic acid molecules are used for producing recombinant polypeptides or transgenic plants with enhanced ability to synthesise carotenoids. Phytoene has been used as a ultra violet absorb and other carotenoids have been used as food colours, animal feeds and

                                                                                                                                                                                                                                                                                              This sequence encodes the phytoene synthetase from Nicotiana benthamiana. The phytoene synthetase coding sequence represents a cDNA of the invention. The isolated nucleic acid molecules are used for producing recombinant polypeptides or transgenic plants with enhanced ability to synthesise carotenoids. Phytoene has been used as a ultra violet absorber and other carotenoids have been used as food colours, animal feeds and in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                              The sequence encodes melon phytoene-synthase (MEL5 gene), and almost full-length. The sequence has been isolated as a cDNA from a ripening-related cDNA library derived from climacteric in the using the tomato phytoene-synthase cDNA (TOM5) as a heterologous probe. The MEL5 gene 5'-end has also been isolat polymerase chain reaction and sequenced. The DNA may be used sense or antisense constructs to modify gene expression in plant particular content and related characteristics of plant particular.
                                                                                                                                                                                                                                    Grierson Watson C;

```
This sequence represents the modified phytoene synthase gene MTOMS, which is also a chloroplast targeting sequence. This sequence is used in the CC method of the invention for enhancing expression of a protein by an CC organism, comprising inserting into its genome a nucleotide sequence CC which produces different RNA on transcription to that of the gene already present, but produces the same protein on translation. Transgenic plants CC with enhanced ability to express a selected can be produced by the CC method. For example, the method can be used to achieve overexpression of CC (especially phytoene synthase), to enhance carotenoid expression, CC (especially phytoene synthase), to enhance carotenoid expression, CC (especially phytoene synthase), to enhance carotenoid expression, CC (inserting a gene construct which is altered by maximising the CC dissimilarity of nucleotide usage whilst maintaining identity of the carotenoid protein sometimes result in low or no expression (CC suppression), as the recombinant of protein compression), as the recombinant of protein compression),
                                                                                   especially when the recombinant and endogenous gene sequences are similar. The method allows enhanced expression whilst avoiding or reducing co-suppression, since sequence similarity between the two is sufficiently reduced.

The specification describes methods for the inhibition and control of gibberellic acid levels. CC Gibberellic acid levels may be inhibited or controlled by use of ca chimeric expression construct expressing a RNA or protein which cc suppresses the gibberellin biosynthetic pathway sequence, diverts constructed from the pathway, or degrades pathway substrates or products. CC substrate from the pathway, or degrades pathway substrates or products. CC 2-oxidase, phytoene synthase, C-20 oxidase, and a 2beta-hydroxylase, cc 2-oxidase, phytoene synthase, C-20 oxidase, and a 2beta-hydroxylase polyniclectides to achieve this. The method is used to control seed CC germination and seedling growth especially to regulate gene products of compared to in transgenic pathway and restoration of normal seed CC germination, in transgenic plants. The plants produced are gibberellin cc deficient, and have shortened hypocotyl and/or epicotyl phenotypes of compared to normal plants.
                                                                                                                                                                                                                                                                                                              US-09-847-081B-2 (1-440) x AAZ99482

                                                                                                                                                                                                       The invention relates to control of gibberellin (GA) levels in plants. CC The method involves producing transgenic plants having a phenotype CC of reduced seed germination and reduced early seedling growth, then CC restoring seed germination and early seedling growth by treating CC plants with an appropriate compound when conditions are favourable. CC The method is useful to control seed germination and/or early seedling CC growth in agricultural production so that unfavorable environmental cc conditions normally reducing agronomic output can be avoided and CC yields increased. Plants also demonstrate increased uniformity of CC germination, emergence and seedling vigor, so increasing yields at CC canola, soybean, cotton, etc., and is also useful in storage and CC transport of seeds to reduce premature germination which may affect CC agronomic or food quality of the seeds. The present sequence is CC tomato phytoene synthase CDNA. This cDNA is used in exemplification CC of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Brown SM,
Piller KJ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Control of gibberellin levels in plants useful to avoid unfavorable conditions in crops to increase yields, using transgenic plants having reduced seed germination and early seedling growth then treatment to restore these properties -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gibberellin; transgenic plant; seed germination; seedling growth; transgenic; phytoene synthase; enzyme; GA; gene; tomato; ss.

                           US-09-847-081B-2
                                                                                                                                            Clone pTOM5 was derived from a cDNA library isolated from ripe tomato RNA (Slater et al., Plant Molecular Biology 5, 137-147, 1985). The protein it encodes is estimated to have mol. wt. ca. 48kD. pTOM5 is expressed in ripening fruit. Strongest expressio at the full orange stage of ripening; no expression is detected green fruit. See also AAQ12494. (Updated on 25-MAR-2003 to correct PA field.)

                                                                  US-09-847-081B-2 (1-440) x AAV16951
                                                                                                                                                                                         The present sequence encodes phytoene synthase 4. It was isolated from a cDNA library prepared from mRNA extracted from the petals of Gentiana lutea. The nucleic acid sequence was amplified from the library using PCR primers AAV16952-53. The phytoene synthase gene is useful for breeding plants with variable flower colours.

                                                                                                                                                                                                                                                                                                                                    The present sequence encodes phytoene synthase 2. It was isolated from a cDNA library prepared from mRNA extracted from the petals of Gentiana lutea. The nucleic acid sequence was amplified from the library using PCR primers AAV16952-53. The phytoene synthase gene is useful for breeding plants with variable flower colours.
                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 2; Pages 7-9; 15pp; Japanese

                                                                                                                                                          (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention.

Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by
                                                                                                                                                                                                                                                             The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising:

(a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    24-AUG-2000; 2000US-227866P
